Print Function

- Print take 1st input as object. It can print any object like int , float , string , complex , list , dictionary even when you define your own class you can print the results

- Print always gives space between 2 object automatically
- But if you concatenate (+) two strings then no space is given between them when you print it
- **Sep** is specifying a separator using which we can separate 2 strings you can use any separator value like - , \ , / , etc…
- Print after printing one line will move to the next
